        Expansins are a novel class of proteins that catalyse the extension of plant cell walls and the weakening of the hydrogen bonds in pure cellulose. 2 Expansins (AAR94528 and AAR94529) have been identified rice and 3 in Arabidopsis (AAR9430-32). A cDNA clone (AAR13320) coding for cucumber expansin 29 (AAR94527) has been obtd. Expansins can be used e.g. in the mfr., de-inking and recycling of paper, in the textile industry, to aid delignification processes, to alter gel
                                                                                                                      Expansin proteins which alter the mechanical strength of poly:saccharide(s) - useful in paper mfr. and recycling

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to enzymes such as seed-specific endo-beta-mannanase (e.g., Lycopersicon esculentum (Le) MAN2), polygalacturonase (PG) (e.g., LexPGl), cellulases such as Cel55 and Cel68, arabinosidase (e.g., LeARA), xyloglucan endotransglycosylases (XET) (e.g., LeXET4) and expansins such as LeEXP4, LeEXP8 and LeEXP10 isolated from germinating seeds. All these enzymes are expressed initially in the endosperm caps and are associated with cell wall hydrolysis. These enzymes are associated with weakening of tissues surrounding the embryo and/or initiating radicle growth. The control cexpression of these endogenous genes is therefore a convenient means fontrolling seed germination. The present sequence is tomato seed expansin, LeEXP8. Expansins are extracellular proteins that facilitate cell wall extension.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel nucleic acid sequences isolated from germinating seeds encoding polypeptides that are useful to control seed germination in plants \,

A cDNA clone (AAR13320) coding for cucumber expansin 29 (AAR94527) has been obtd. Expansins can be used e.g. in the mfr., de-inking and recycling of paper, in the textile industry, to aid delignification processes, to alter gel mechanical strength, etc.
                                                                                                                                                                             Cucumber

Expansin proteins have also been identified in out coleoptiles, in Arabidopsis (see AAR94530-32) and in rice (AAR94528-29), and appear to be broadly distributed throughout the plant kingdom. Expansins can be used e.g. in the mfr., de-lnking and recycling of paper, in the textile industry, to aid delignification processes, to alter gel mechanical strength, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cucumber expansin-29 (AAR94527) is a member of a novel class of proteins that catalyse the extension of plant cell walls and the weakening of the hydrogen bonds in pure cellulose. It can be obto by expression of an isolated cDNA clone (see AAT13320) in bacterial or

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

   pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
